Malwarebytes

Malwarebytes Techbench is a portable product which runs from a special USB drive created to provide a solution for PC repair shops to be able to service their customers' systems to rid them of malware using the powerful detection and removal technologies found in Malwarebytes Anti-Malware.

Malwarebytes Anti-Malware is considered to be the next step in the detection and removal of malware. We have compiled a number of new technologies that are designed to quickly detect, destroy, and prevent malware. Malwarebytes Anti-Malware can detect and remove malware that even the most well-known antivirus and antimalware applications on the market today cannot.

In addition to Malwarebytes Anti-Malware, Malwarebytes Techbench also includes our cutting edge Malwarebytes Chameleon technology, designed to get Malwarebytes Anti-Malware running in hostile environments where other anti-malware applications and tools are helpless.

Performing Scans

Scans may be run on infected systems using the “Start a scan with Malwarebytes Anti-Malware” checkbox and choosing from any of the options below:

- **Quick Scan:** Scans all system locations where malware is known to install itself. This is the scan type recommended by Malwarebytes.
- **Full Scan:** Scans every file on the drives you select in addition to all of the areas checked by the quick scan.

- **Flash Scan:** Scans system memory and startup locations for active infections. It also checks key locations using heuristics.

- **Automatically remove all threats found:** This option, which is only available if you made the scan silent, will have Malwarebytes Anti-Malware remove any detected threats automatically.
- **Restart the computer if needed:** This option, which is only available if you made the scan silent and used the "Automatically remove all threats found" option, will have Malwarebytes Anti-Malware reboot the system if it is required in order to complete the threat removal process.

Simply run **mbam.exe** and access the **Quarantine** tab and use the available controls to restore objects from quarantine or to delete the quarantined backup copies from the drive.
